PROFESSIONAL SUMMARY

Full-Stack Engineer experienced in designing, building, and operating scalable web and mobile applications, distributed backend services, and real-time transaction platforms. Proficient in Go, TypeScript, C#, Java, React, PostgreSQL, Redis, Apache Kafka, and Kubernetes, with experience spanning system architecture, API development, database design, event-driven processing, cloud infrastructure, and production observability. Delivered solutions across last-mile logistics, financial transaction processing, and fraud detection, with a focus on performance, reliability, data consistency, and measurable business outcomes. Experienced in technical leadership, architecture reviews, code quality, and mentoring engineers.

TECHNICAL SKILLS

Programming Languages: Go, TypeScript, JavaScript, C#, Java, Python, SQL

Frontend & Mobile Development: Angular, React, Next.js, React Native, Redux Toolkit, Zustand, React Query, Tailwind CSS, ShadcnUI

Backend & API Development: Node.js, NestJS, Express, ASP.NET Core, Spring Boot, Gin, FastAPI, Django, REST APIs, WebSockets, SignalR

Databases & Messaging: PostgreSQL, PostGIS, MongoDB, Redis, Apache Kafka, RabbitMQ, Data Modeling, Query Optimization, Geospatial Queries

Cloud & Infrastructure: AWS (EKS, Lambda, RDS, S3), Microsoft Azure, Docker, Kubernetes, Terraform, GitHub Actions, CI/CD

Architecture & System Design: Distributed Systems, Microservices, Event-Driven Architecture, System Design, Idempotency, Double-Entry Ledger Systems, Concurrency, Caching, Asynchronous Processing, API Security

Testing & Observability: Jest, Playwright, xUnit, Pytest, k6, OpenTelemetry, Prometheus, Grafana, Sentry, Automated Testing, Performance Testing

Engineering Practices: Code Review, Architecture Reviews, Technical Documentation, Production Debugging, Performance Optimization, Technical Interviews, Mentoring

PROFESSIONAL EXPERIENCE

Full-Stack Engineer | Send24, NQB8

Lagos, Nigeria | February 2025 – October 2026

Send24 is a last-mile delivery platform comprising customer and rider applications, a merchant dashboard, and a dispatch control centre.

- Designed and developed dispatch, tracking, and settlement services using ASP.NET Core, Spring Boot, PostgreSQL, and PostGIS, supporting a network of more than 1,800 riders across Lagos, Abuja, and Port Harcourt.
- Engineered an automated rider-dispatch engine using Redis geospatial queries, reducing rider assignment time from approximately nine minutes to under one minute.
- Implemented real-time order tracking using SignalR and Google Maps, contributing to a 55% reduction in order-status support tickets and improving delivery visibility for customers and merchants.
- Developed an offline-first React Native rider application with background synchronization and resilient status updates, maintaining delivery data accuracy in areas with unreliable network connectivity.
- Implemented OTP verification and photo-based proof of delivery to strengthen delivery accountability, improve auditability, and support dispute resolution.
- Automated cash-on-delivery reconciliation and settlement workflows, improving transaction traceability and reducing manual reconciliation overhead.
- Integrated application and backend workflows across order creation, dispatch, delivery confirmation, and settlement to support reliable end-to-end delivery operations.

Full-Stack Engineer | GMP, PikaGroup

Lagos, Nigeria | January 2023 – January 2025

GMP is a peer-to-peer sports wagering platform supporting bet creation, matching, escrow-based wallet operations, and automated settlement.

- Led a squad of six engineers responsible for wagering, wallet, and payment systems serving more than 250,000 registered users; conducted technical interviews and mentored three engineers.
- Designed a Go-based wager-matching engine that paired opposing bets in under 30 milliseconds, supporting partial matches, concurrent requests, and automated refunds.

- Architected an escrow wallet backed by a double-entry ledger and idempotent Kafka event processing, supporting more than three million bet settlements without recorded balance discrepancies.
- Prepared the platform for peak sporting events through Kubernetes autoscaling, Redis caching, and k6 load testing, supporting more than 40,000 concurrent users during high-demand periods.
- Automated bet settlement using live sports data feeds, reducing manual intervention and settlement delays following match completion.
- Implemented KYC verification workflows, responsible-gaming controls, and audit reporting to support regulatory compliance and review by the Lagos State Lotteries and Gaming Authority.
- Contributed to system architecture, API design, code reviews, and production reliability improvements across core transaction services.

Freelance Full-Stack Engineer | Fraud Detection, Devheit

Remote | 2024 – 2026

Contract engagement building fraud detection services (Just Rever) and analyst tooling for transaction-intensive products.

- Built a real-time fraud-scoring service using Python and FastAPI, combining a configurable rules engine with a scikit-learn model to evaluate transaction risk.
- Developed a React and TypeScript dashboard for reviewing flagged transactions, recording analyst decisions, and collecting feedback to support model improvement and retraining.
- Implemented detection workflows for account takeover, device and IP velocity anomalies, and linked-account activity, using Redis for low-latency feature lookups.
- Containerized services with Docker and automated build and deployment workflows using GitHub Actions, improving deployment consistency and maintainability.
- Integrated Prometheus monitoring and alerting for scoring latency and model drift to improve operational visibility and support timely investigation.
- Delivered integrated backend APIs, data-processing workflows, and frontend investigation tools for fraud analysis.

SELECTED PROJECTS

Idempotency Middleware for Payment APIs

Technologies: Go, Node.js, Redis, PostgreSQL

- Designed reusable idempotency middleware for Go and Node.js applications, supporting integration with net/http, Gin, Express, and NestJS.

- Implemented idempotency keys and request fingerprinting to identify duplicate requests and protect payment and transfer endpoints against unintended repeated processing.
- Used Redis-based coordination and PostgreSQL persistence to support request deduplication and durable idempotency records.
- Structured the middleware for transaction-sensitive APIs requiring safe retries, predictable request handling, and consistent processing outcomes.

Webhook Relay for Nigerian Payment Gateways

Technologies: Go, Apache Kafka, PostgreSQL, Docker

- Designed a self-hosted webhook relay for Paystack, Flutterwave, and Monnify integrations, centralizing payment event ingestion and distribution.
- Implemented webhook signature verification and event deduplication to validate incoming events and reduce duplicate processing.
- Designed asynchronous event distribution with Kafka, retry handling, and dead-letter queues to improve resilience when downstream services become unavailable.
- Incorporated event recovery and replay workflows to support troubleshooting and controlled reprocessing of failed webhook deliveries.
- Structured the service around containerized deployment and persistent event records to improve maintainability and operational visibility.
